

Storage Access Framework

or Yay, new API's!

What

The SAF makes it simple for users to browse and open documents, images, and other files across all of their preferred document storage providers. A standard, easy-to-use UI lets users browse files and access recents in a consistent way across apps and providers.

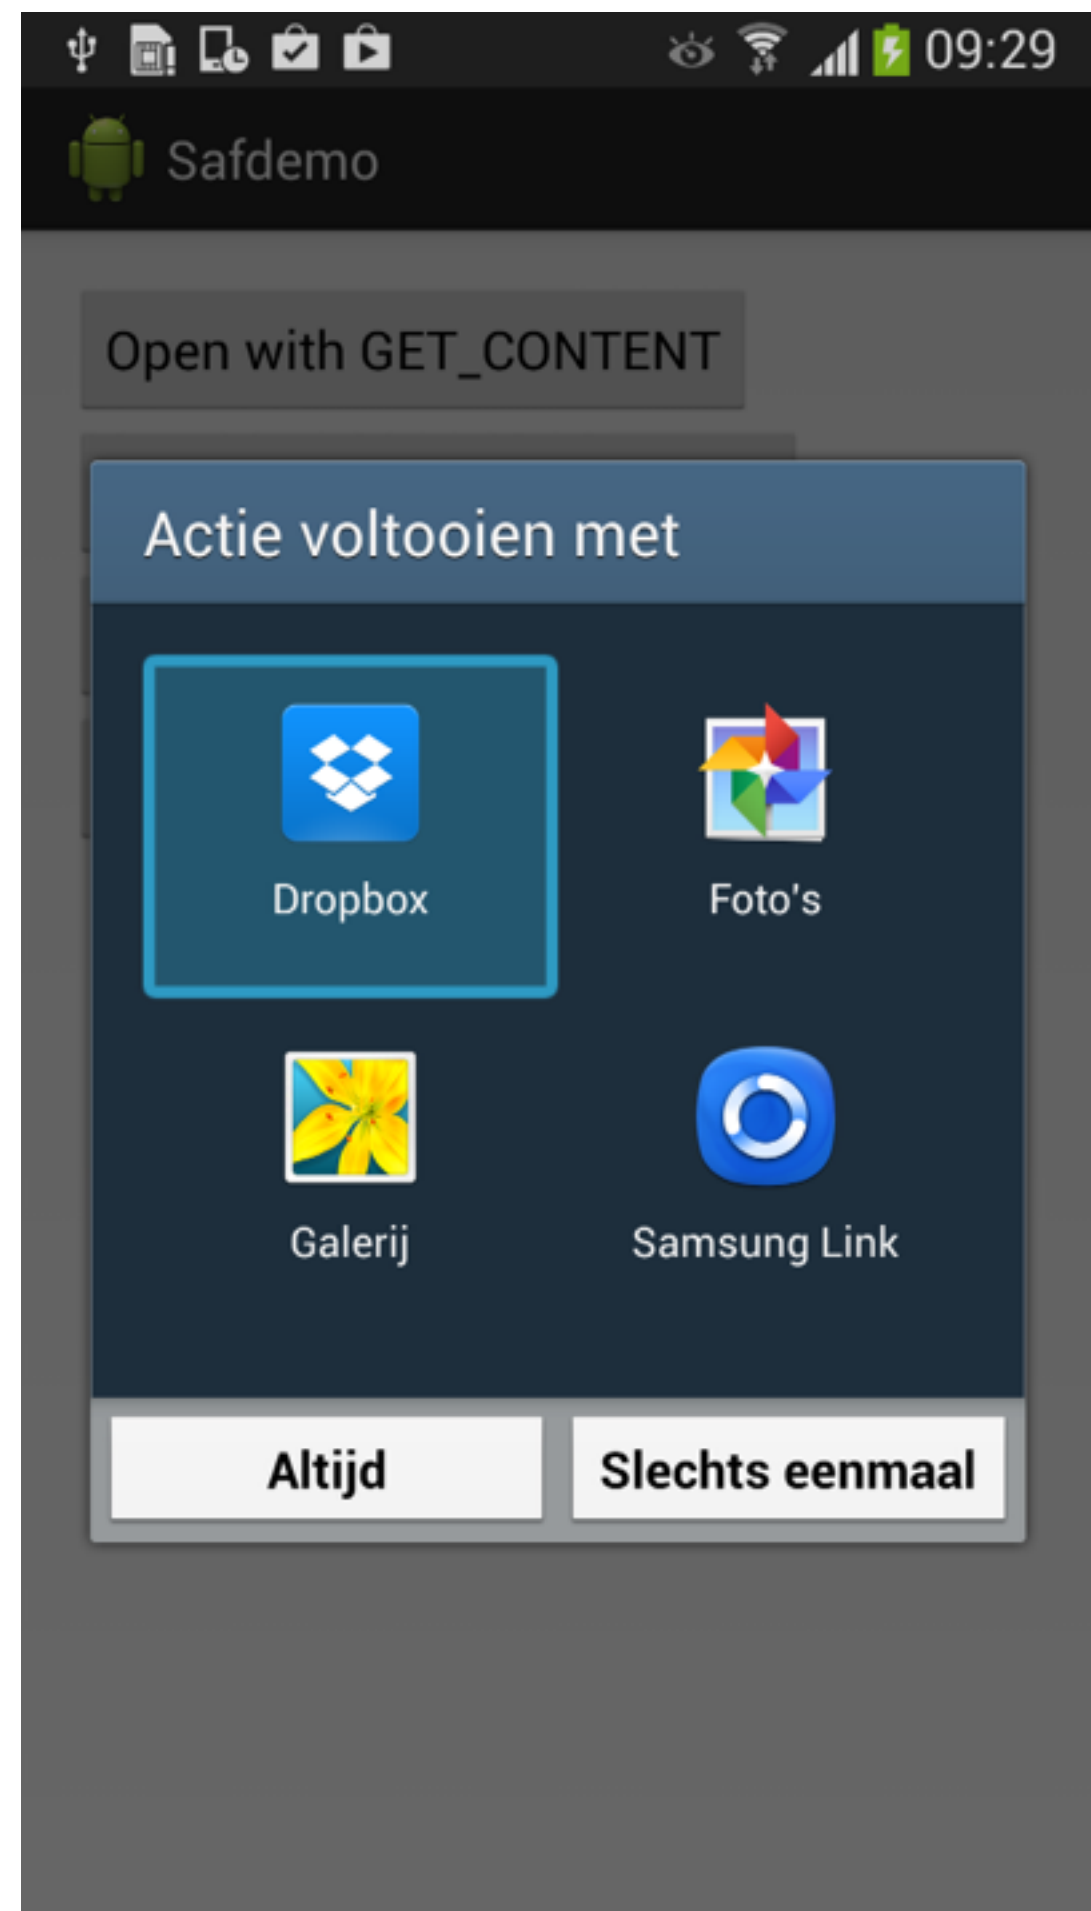

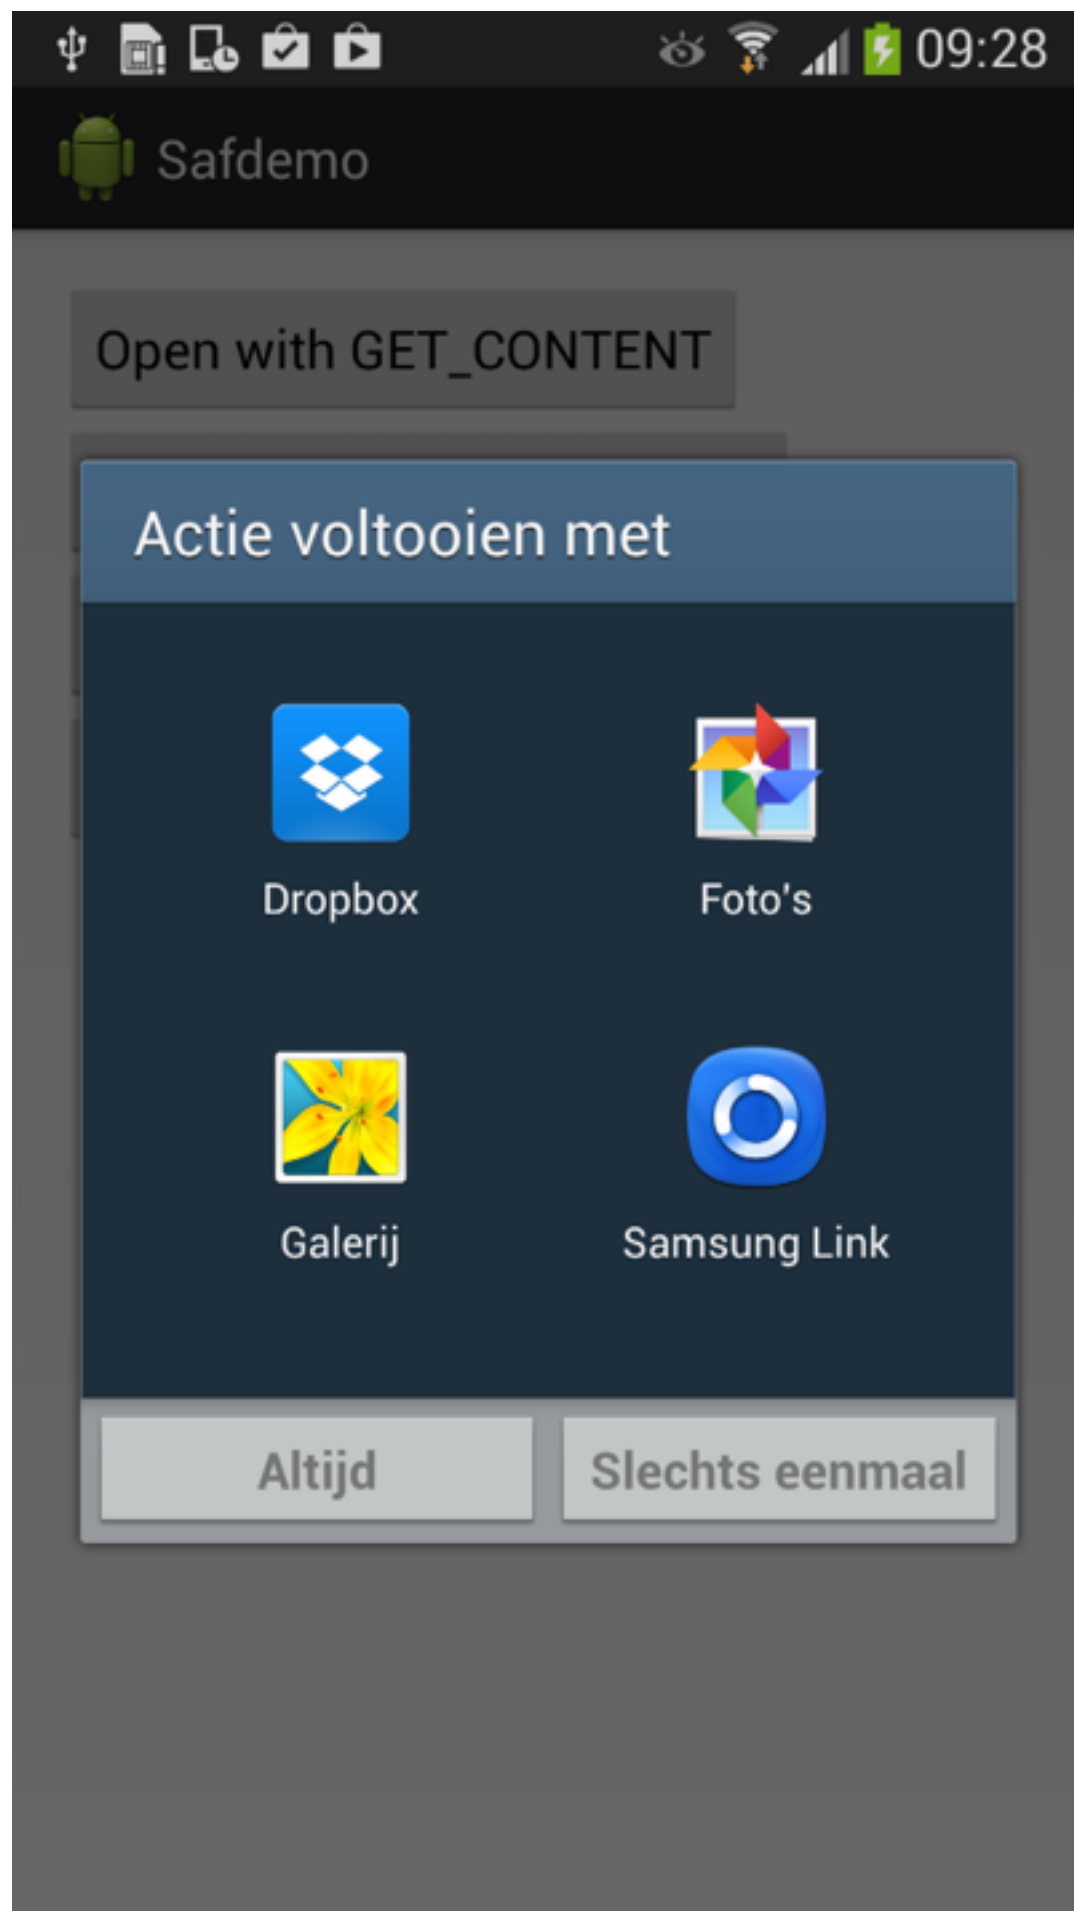

Why

*The SAF makes it simple for users to **browse** and open documents, images, and other **files** across all of their preferred document storage providers. A **standard**, easy-to-use UI lets users browse files and **access recents** in a **consistent** way across apps and providers.*

Before KitKat

```
Intent intent = new Intent(Intent.ACTION_GET_CONTENT);  
intent.setType("image/*");  
startActivityForResult(intent, REQUEST_CODE);
```

```
void onActivityResult(int requestCode, int resultCode, Intent data) {  
    // check request code and result code  
    Uri uri = data.getUri();  
    // read it  
    InputStream input = getContentResolver().openInputStream(uri);  
}
```

 Safdemo

Open with GET_CONTENT

Open with GET_CONTENT

Open with GET_CONTENT

KitKat

ACTION_OPEN_DOCUMENT

```
Intent intent = new Intent(Intent.ACTION_OPEN_DOCUMENT);  
intent.setType("image/*");  
intent.addCategory(Intent.CATEGORY_OPENABLE);  
startActivityForResult(intent, REQUEST_CODE);
```

```
void onActivityResult(int requestCode, int resultCode, Intent data) {  
    // check request code and result code  
    Uri uri = data.getUri();  
    // read it  
    InputStream input = getContentResolver().openInputStream(uri);  
}
```

Safdemo

Open with GET_CONTENT

Open with GET_DOCUMENT

Open a text document

Create a text document

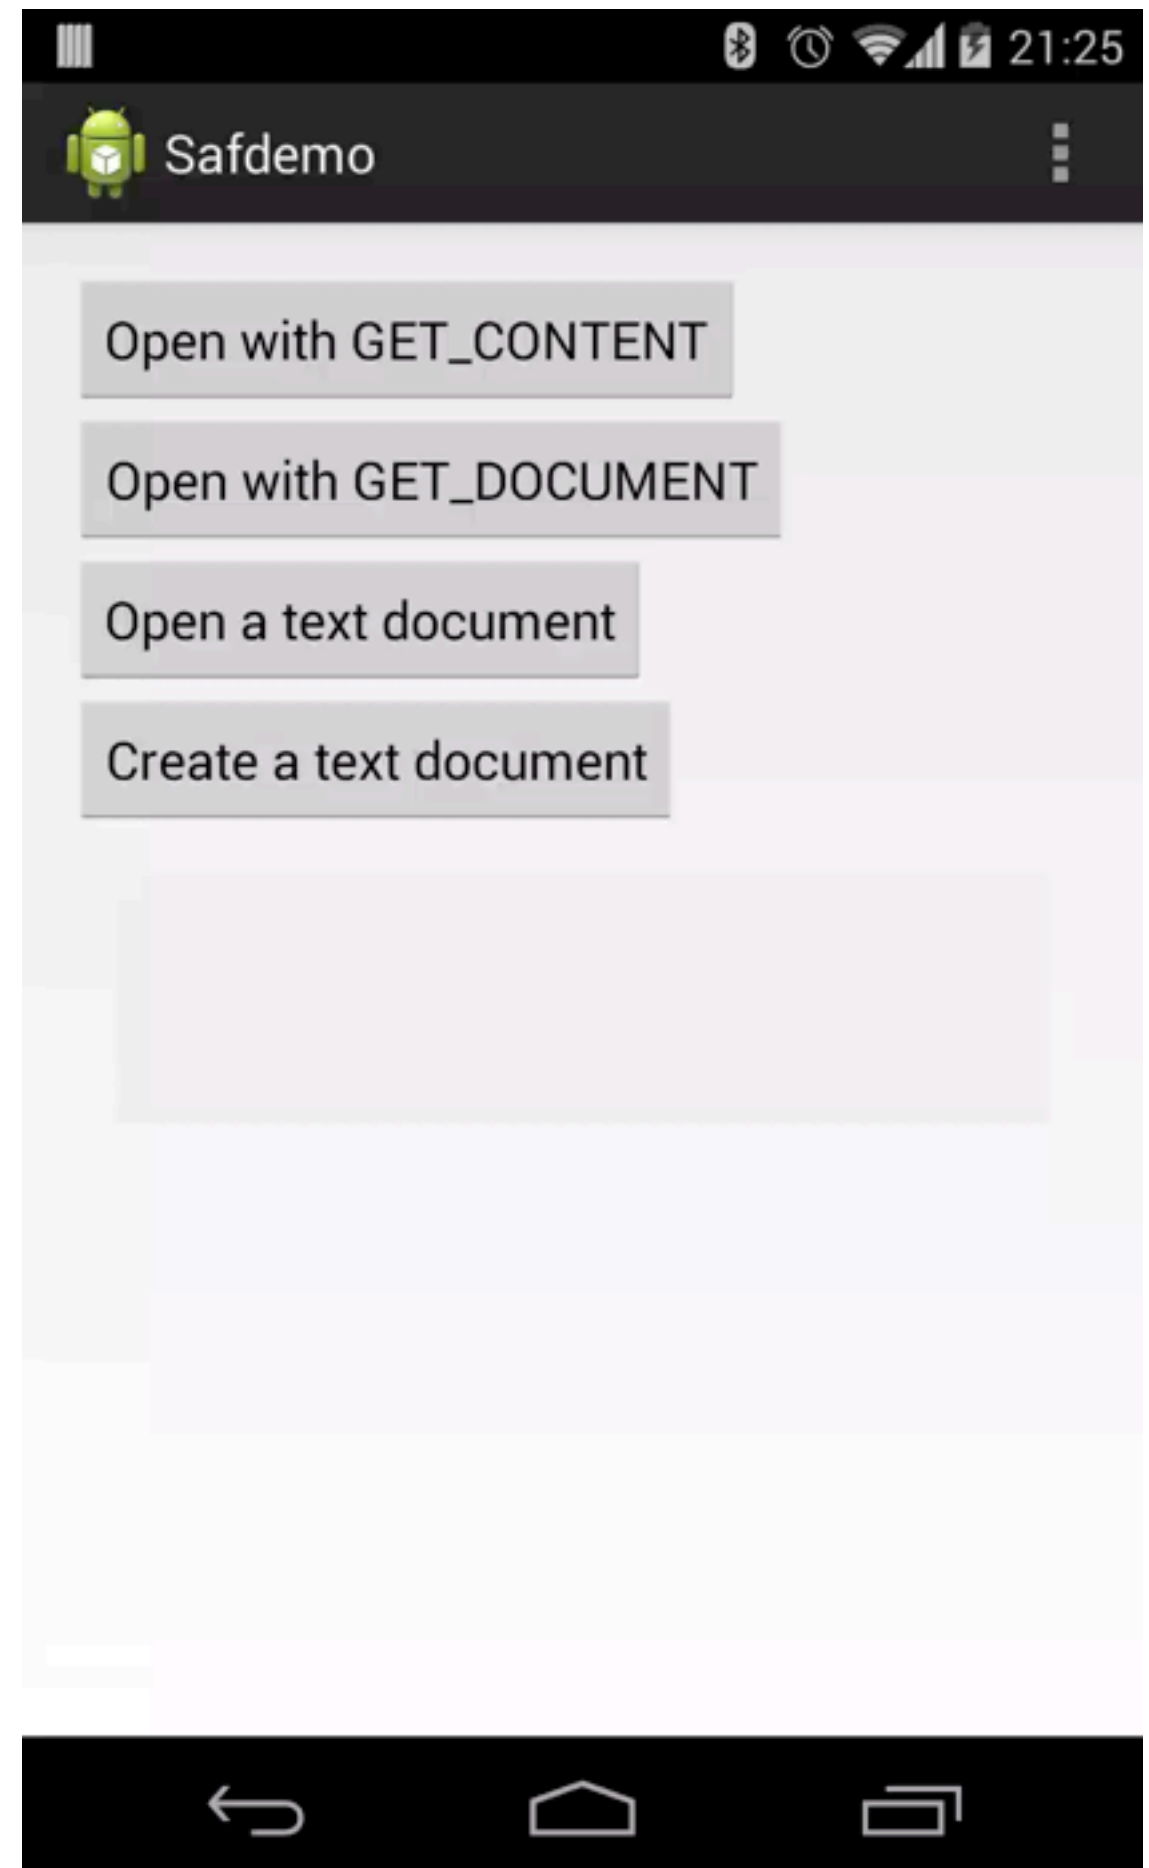

Persistent permissions

"Use ACTION_GET_CONTENT if you want your app to simply read/import data. With this approach, the app imports a copy of the data, such as an image file.

Use ACTION_OPEN_DOCUMENT if you want your app to have long term, persistent access to documents owned by a document provider. An example would be a photo-editing app that lets users edit images stored in a document provider."

```
getContentResolver().takePersistableUriPermission(uri, takeFlags);
```

ACTION_CREATE_DOCUMENT

Document Providers

Based on ContentProviders, subclass DocumentProvider

- queryRoots()
- queryChildDocuments()
- queryDocument()
- openDocument()

New api's on ParcelFileDescriptor as well

Compatibility

Only on API level 19 and up (platform change)

“Enhance” for API ≥ 19

So...

Existing apps get better UX for free

For “long time relation” apps use GET_DOCUMENT

Implement DocumentProvider for 3rd party apps creating docs in your app (e.g. cloud service)

There will be no backward support for this feature
